We started with an agent and built it into our systems

Our agent-platform journey · Microsoft · 15 October 2026

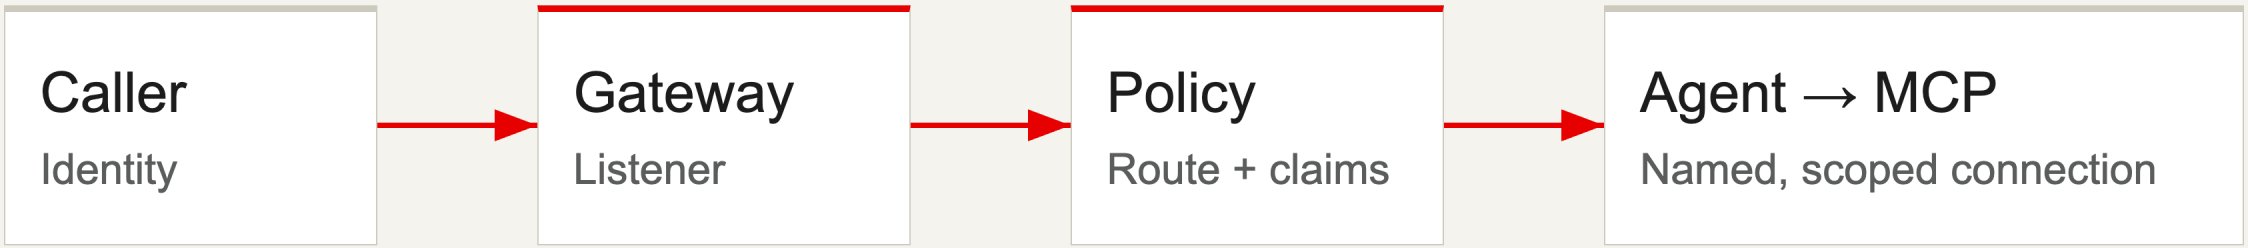

The same components power automated workflows and interactive investigation.

The journey: configuration → connections → access controls → operational use

We keep one front door and separate locked lanes

The isolation presentation defines ownership and blocks the side doors.

Platform owns

Gateway, routes, policies, grants and shared credentials

Team owns

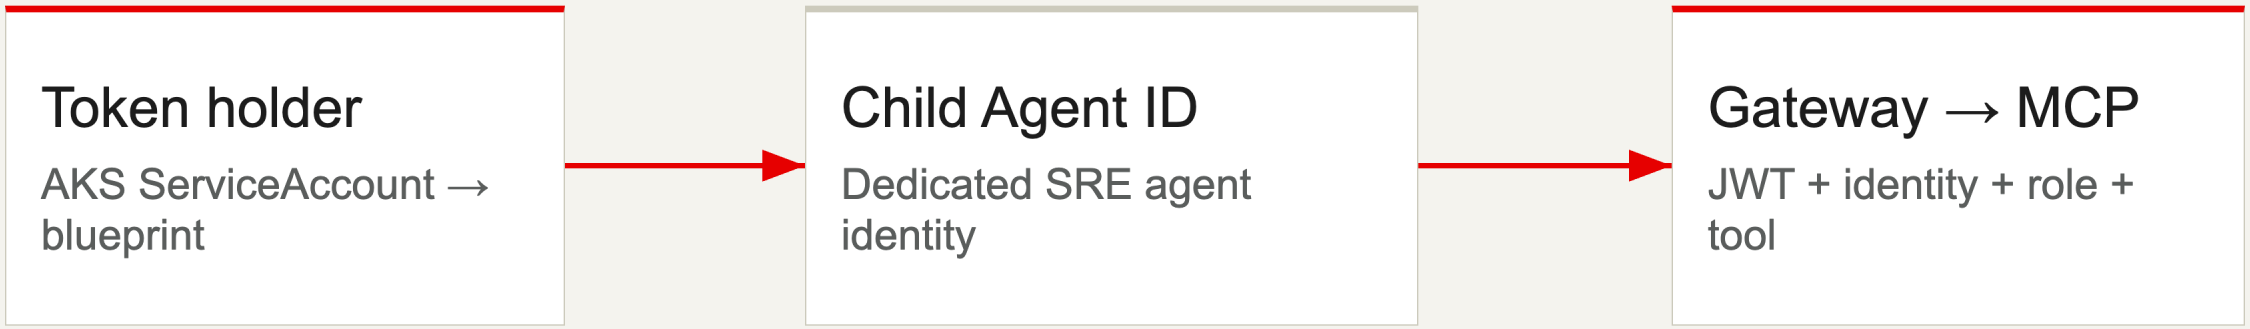

Agent, prompt, skills and approved MCP workload

Default-deny network, RBAC and admission controls restrict direct bypass.

Adapted from the existing tenant-isolation ownership and request-chain slides

A blueprint creates agent identities with accountable access

Microsoft Entra issues the access token. JWT is its signed format; the gateway validates it.

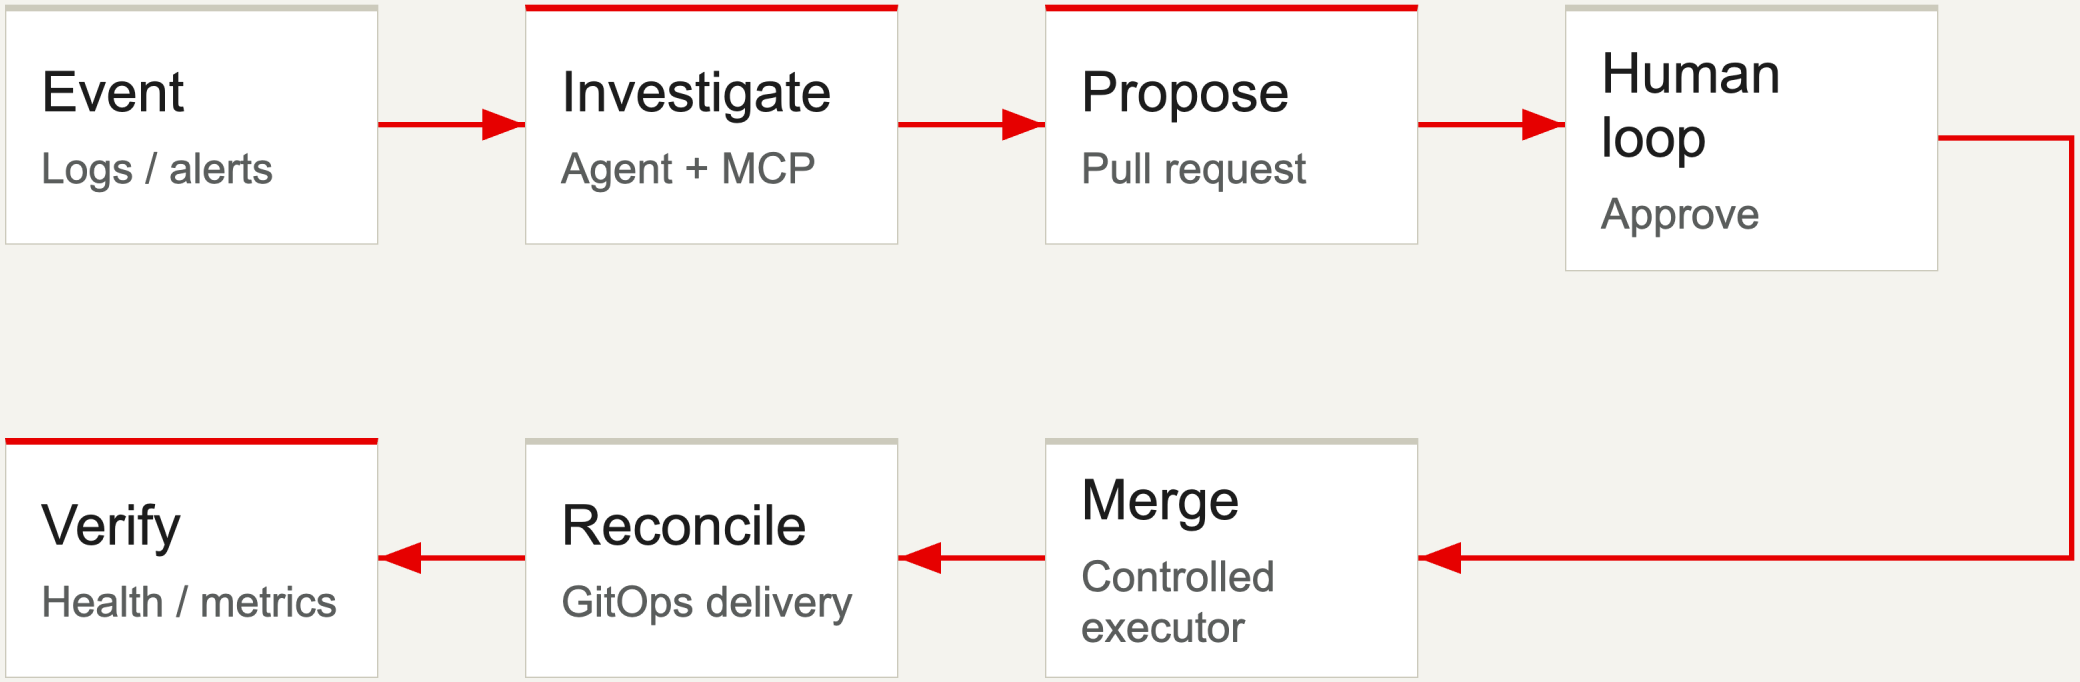

Inbound: calling app / UAMI → A2A API token → named agent

Outbound: blueprint exchange → child MCP API token → named tools

An event becomes a reviewed change and a verified outcome

AI triage produces a proposed fix. A human releases the change.

Verify after merge; if the issue persists, feed the evidence back into the loop

We connect AI to the operational context it needs

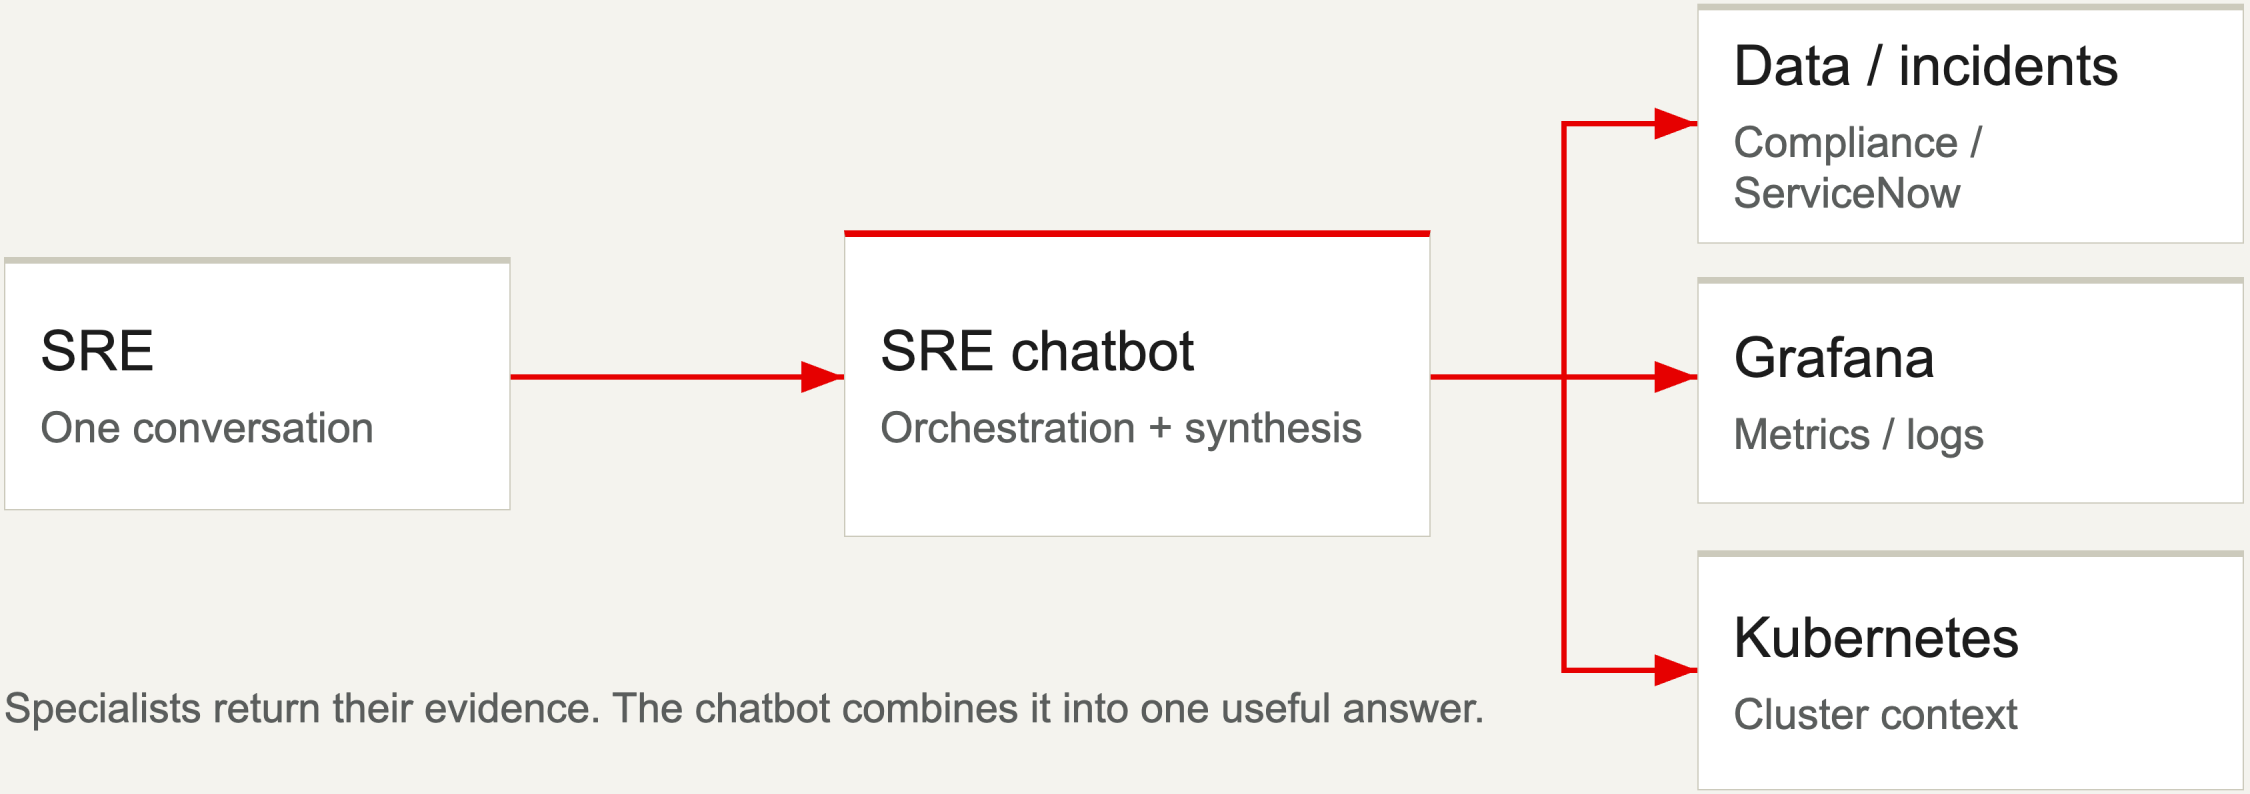

The agent can look beyond the original event.

01	GitLab / ServiceNow	Changes, incident context and accountable follow-up
02	Postgres / Denodo	Approved data and compliance investigation
03	Grafana	Metrics, logs and deeper application evidence
04	Kubernetes / AKS	Cluster triage, analysis and approved remediation

Each integration retains its own data permissions and read / write boundary

The SRE chatbot brings specialist answers into one pane

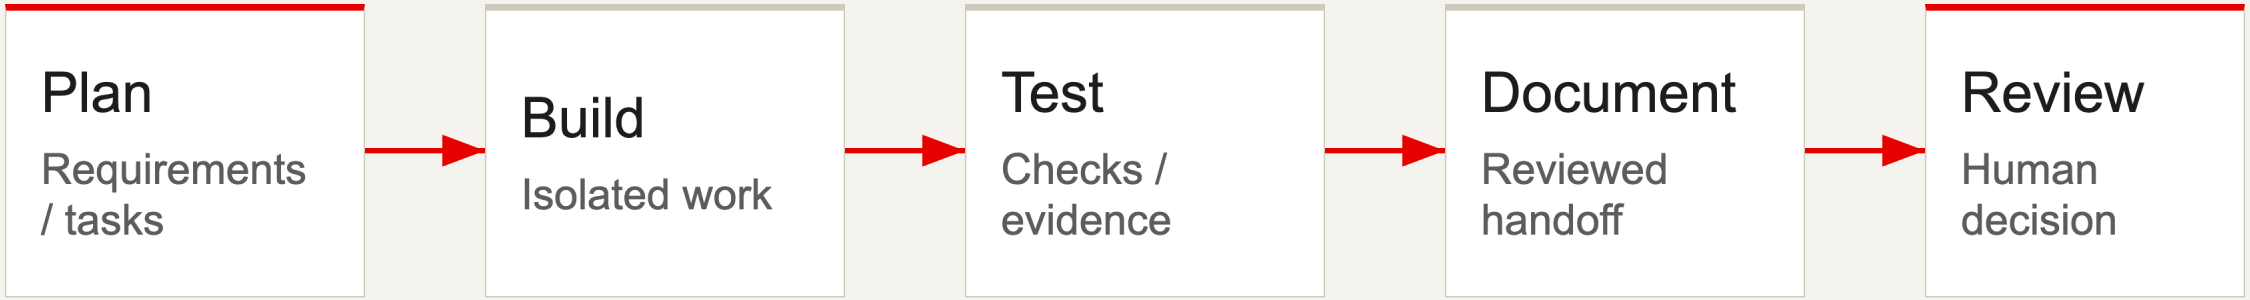

SRE asks one question. The orchestration agent consults the relevant agents.

Specialists return their evidence. The chatbot combines it into one useful answer.

We use the same agent components throughout SDLC

Planning, building, testing and documentation become connected work.

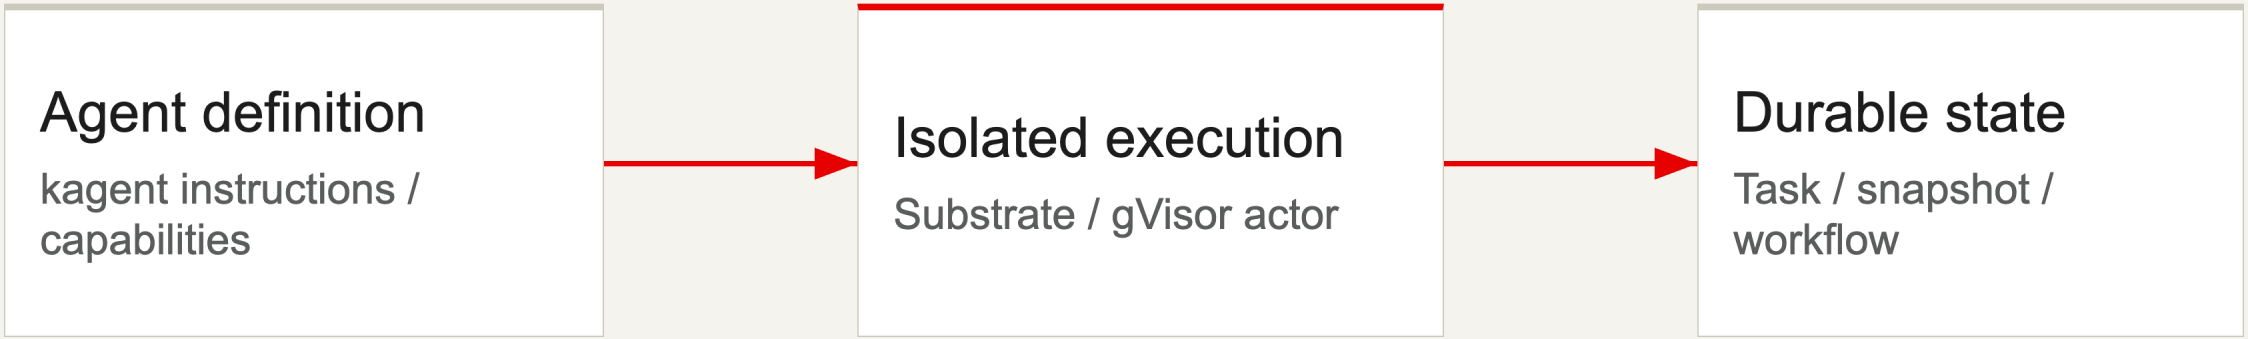

Each stage reuses approved models, tools and skills, with a traceable handoff.

A reviewable change and its checks are the output; release authority stays explicit

Isolation and durability support the next stage of the journey

Substrate and durable-agent work sit beneath the same integration model.

We are extending the runtime while preserving the tool and identity boundaries.

Supporting work: recorded actor lifecycle and Pi recovery observations; paired comparison remains open

One set of components now supports several AI journeys

The same components support automated triage, interactive SRE and SDLC.

01

Event-driven triage

Event, investigation, PR, human approval and verification

02

Interactive SRE

One chatbot brings back data, metrics and cluster evidence

03

Agent-assisted SDLC

Plan, build, test and document a reviewable change

Agent → skills / tools / models → gateway controls → AI in our systems
